

# INFO 101 Class Two

**Thurs. March 31, 2022**  
**Topics: Builders tab, HTML**

# Today's Plan: Complete a Builder

**Create a  
Github  
Account and  
Repository**

**“Hello  
World”  
Activity**

**Upload  
Files**

**Workshop**

**01.**

# **Create a Github Account and Repository**

The background is a light beige color with several abstract geometric shapes. In the top left, there is a dark green circle partially cut off by the edge. To its right is a thin black outline of a circle. On the right side, there is a large orange shape resembling a stylized 'G' or a thick 'C'. Below it is a dark blue circle with a thin black outline. In the bottom left, there is an orange curved shape and a green circle. At the bottom center, there are two orange circles, one slightly to the left of the other, both with thin black outlines.

**What is  
Github?**

- **Git** is the most popular **version control system**
  - A version control system is a system that records changes to a file so a specific version of a file can be restored later if needed
- It is used for coordinating work among groups of people and tracking progress
- **Github** is a **Git repository hosting service**, so it allows people to do collaborative work through a web-based graphical interface

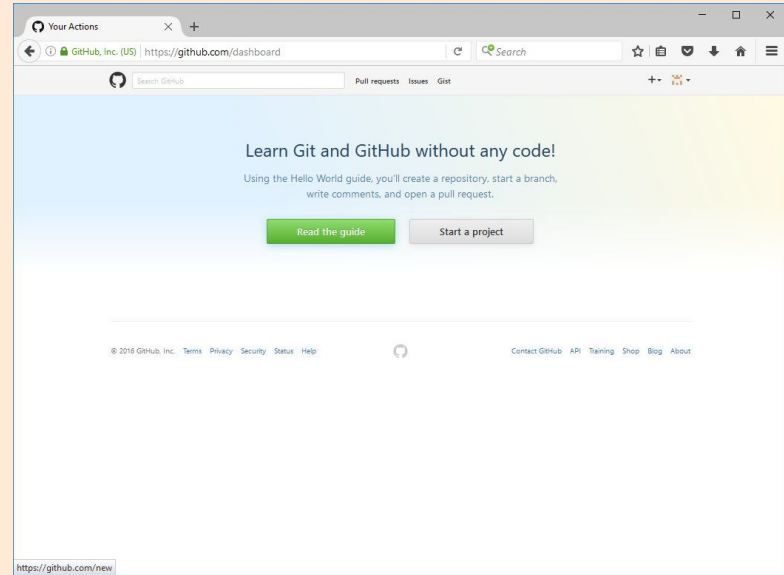

# Establishing a Website: Account

1. Go to the Builder Tab on gClass
2. Create a Github account:  
<https://github.com/join?source=header-home>
  - a. Please make your username your UW netId - your student number. We need you to make a new account with this specific name so we can find you.
    - i. Ex: coreya04-12345678
  - b. Use a valid email account because Github will use it to verify your account

# Establishing a Website: Confirm

After you've created your account you'll need to confirm your email:

1. Click "Start a Project"
2. Wait for the email to arrive and then click the link it sends you.
3. Github should take you back to the Start A Project Page.

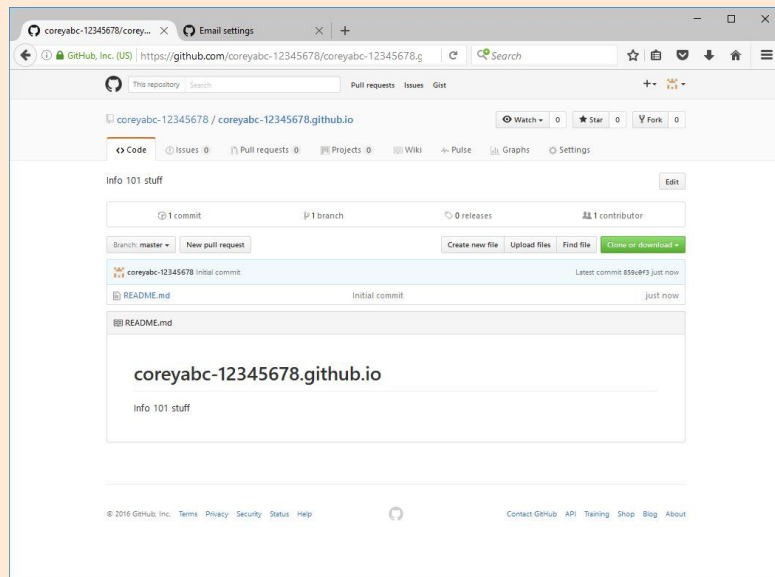

# Establishing a Website: Repository

After you've confirmed your email:

1. Click on “Start a Project” or find your way to the Repositories Page
2. Click “Create one” (but don’t fill in the info yet)
3. After pressing Create Repository you should land at a page that looks like this:

# Establishing a Website: VSCode

After creating a repository:

1. Download Visual Studio Code, Notepad++ or TextWrangler (OSX)
2. Create a new file in your application and name it index.html
3. Write this code

```
<!DOCTYPE html>
<html>
  <head>
    <title>Hello World</title>
  </head>
  <body>
    <h1>Hello World</h1>
  </body>
</html>
```

# Establishing a Website

Open the file and make sure it looks like this in your browser:

# Establishing a Website: Upload

Now you have a Web page and you have Github set up to put this and any other pages on the web for you.

1. Go to <https://github.com> and navigate to the repository you created
2. Press the “Upload Files” button
3. Upload your index.html file

Your first page should now be on the Web at  
[https://\[netId\]\[student number\].github.io/](https://[netId][student number].github.io/)

The background is a light beige color. It features several abstract geometric shapes: a large orange rectangle in the upper center, a large orange circle in the upper right, a green curved shape below the orange circle, and a wavy orange line with a small orange circle at the bottom left.

02.

**Workshop!**

# I will show you how to embed...

**01.**

Images and videos  
from your  
computer's files

**02.**

Youtube Videos

**03.**

Google Maps

**04.**

Soundcloud Songs

# Embedding Pictures and Videos

Some embeds are simply HTML tags that tell the browser to put something on the page

- `<img>` tag is one of the basic media tags
- In HTML 5 there is an `<audio>` tag that lets you embed a little audio player in your page.
- Similarly there is a `<video>` tag that lets you embed a video on your page.

# Embedding Web Media using iFrame

- `<iFrame>` is a way to insert someone else's web page inside yours.
- The `<iframe>` tag is an easy way to embed media from other websites.
- For Youtube videos, you just have to copy and paste the iFrame code from the "share" button of a video and click "Embed" to get the HTML code.

03.

# Original Work

# Embed Files in your HTML Document

When you are satisfied with the files you have submitted, click the button below to certify that your files are uploaded.

Click to certify that all the above links Work

Toggle this on to let me know you are ready to be graded!

You can also toggle it off if you don't want me to grade.

Here is what to create for the different original work levels:

- **Level 1: Newbie.** Show us a page that has:
  1. A Youtube video
  2. A google map
  3. One more thing that we did not demo in the workshop
- **Level 2: Apprentice.** Show us a page that has:
  1. A Youtube video that plays starting at minute 3
  2. A video that plays using the HTML5 video tag
  3. Something using the object tag
- **Level 3: Master.** Show us a page that has:
  1. A Youtube video that plays starting at minute 3 and another feature that you can't get from the basic embed code you paste from Youtube
  2. A video and audio file that plays using the HTML5 video and audio tags
  3. Something using the object tag that is not flash
  4. An RSS feed displayed
